

# Kinnegrip is expanding with a new facility and logistics center in Poland

With a high and steadily growing export market, Kinnegrip will establish a facility and logistics center in the city of Kostrzyn, Poland. This will reduce the transport distance to European customers and have a significant impact on CO2 emissions. In terms of logistics, it will have a positive effect on service , lead-time, and flexibility.

“Our ambition is to always provide customers and the market with the highest values in terms of product, quality, service and sustainability. This step in our development will further strengthen this”, says Johan Andersson, Managing Director at Kinnegrip.

Throughout the years since founded in Sweden in 1966, Kinnegrip has had a close relationship with Europe, through own sales offices and dealers.

Some manufacturing and assembly processes will also be transferred from Sweden to the facility in Poland. The head office, administration, and customer support will remain in Lidköping Sweden, as well as the production of steel parts and certain aluminum parts.

Kinnegrip develops, manufactures and markets safety solutions for transports to European and Global companies and brands. Kinnegrip has about 50 employees and a turnover of approximately SEK 100 million. The product offering covers the segments of light-, medium-heavy, and heavy-duty commercial vehicles. Development and manufacturing take place at the facility in Lidköping, Sweden
